

Activity 1: Job Hunt Intelligence Test

Step 1: Pick a Job Scenario

- Resume writing
- Interview preparation
- Career switching
- Salary negotiation
- Networking / LinkedIn outreach
- Job application strategy

Step 2: Prompt Your AI

Use this: “Create a 10-question quiz for job seekers on [your scenario].

Include:

- 2 trick questions that sound correct but are actually wrong
- realistic scenarios (not textbook theory)
- an answer key with short explanations”

Step 3: Take the Assessment

Note: Don’t overthink. Answer like you would in real life, not what you *think sounds smart*.

Step 4: Audit the AI

Now switch gear from *user* → *evaluator*. This is the real learning

Ask:

- Which answers are actually useful vs generic fluff?
- Did any “correct” answers feel questionable?
- Were the trick questions truly misleading—or just badly written?
- Does this advice work in **Singapore** / your **industry** context, or is it too generic?

Step 5: Improve the System

Now refine your prompt using ICCO (customize below to suit your needs):

- **Instruction:** “Create a 10-question quiz focused on job search strategies for fresh graduates entering the workforce”
- **Context #1:** “Target audience: 20–27 years old, recent graduates in Singapore, limited work experience, applying for entry-level roles, concerned about competitiveness and job stability” **OR**
- **Context #2:** “Fresh graduates competing in a saturated job market, applying through LinkedIn, job portals, and referrals, with little to no internship experience”
- **Constraints:** “Keep explanations under 2 sentences. Avoid generic advice. Include 2 trick questions that sound correct but are wrong”
- **Output format:** “Return in table format: Question | Options | Answer | Explanation”

Step 6: Re-run & Compare

Point for reflection:

- Did the second version feel sharper?
- Less generic?
- More aligned to real-world decisions?
